

How does the Photizo® Skin Care assist in alleviating skin conditions?

Cosmetic and anti-aging treatments

Photizo® Skin Care stimulates collagen and elastin formation, aiding anti-aging skincare treatments. The reduction in inflammatory responses decreases the occurrence of post-inflammatory hyper pigmentation associated with acne, sunburn, and injuries or treatments like peeling and hot laser treatments. Treatment with the Photizo® Skin Care will reduce and regulate the melanin production and lessen the chance of developing chloasma, pigmentation or age spots.

Photizo® Skin Care ensures optimum cell condition and function, assisting in the healing process, reducing scar and keloid formation, infections, pain, bruising and swelling. Photizo® Skin Care increases the secretion of endorphins and serotonin when applied in painful and skin irritation conditions, thereby relieving pain and discomfort. Light therapy increases lymph drainage and improves blood circulation, greatly enhancing the hydration levels within the skin tissues. Combined with skin care products and resurfacing treatments, skin texture and colour can be greatly improved. Treatment with the Photizo® Skin Care strengthens the structural bonds (collagen) and reduces inflammatory conditions that can manage coupe rose, overall redness, rosacea and flushing.

Photon Therapy Systems

Wound healing

Photizo® Skin Care stimulates the production of ATP, the cellular energy that is needed for healing and cellular regeneration, and helps with pain relief via the stimulation of endorphin and serotonin secretion, thereby reducing swelling and inflammation.

Treatment with Photizo® Skin Care increases the blood and lymph diameter, thereby increasing the removal of debris and inflow of oxygen and nutrients, helping cells to function at optimum levels, as well as stimulating fibroblast and collagen formation needed for wound closure. Treatment with the Photizo® Skin Care controls scar tissue formation via the stimulation and regulation of DNA and RNA synthesis, ensuring a reduction in scar tissue formation as well as the stimulation of the local and systemic immune system to clear infections.

Acne and pimples

Treatment with Photizo® Skin Care reduces the inflammation and swelling that blocks the ability of the cells to absorb nutrients and oxygen. Light therapy optimises the clearance of excess waste products, normalises skin pores, pigmentation and radiance and controls excess scarring, via the stimulation and regulation of DNA and RNA (the cellular programmes). Treatment with Photizo® Skin Care speeds up the natural healing process.

Photon Therapy Systems

Psoriasis, dermatitis and eczema

Photizo® Skin Care reduces skin irritation, discomfort and itching, optimises skin condition, regulates normal cell functioning and stimulates the local autoimmune system. Photizo® Skin Care reduces scaling and flaking by stimulating normal skin cell regeneration.

Skin inflammatory conditions: Insect bites, pressure points, sunburn etc.

Photizo® Skin Care reduces itching, irritation, swelling and inflammation and assists in rapid healing and repair of damaged cells.

Cold sores

Treatment with Photizo® Skin Care stimulates the local and systemic immune system to recognise the Herpes Simplex virus and generates antibodies against the virus. It will reduce the incidence of recurrence and in optimal conditions, the body will create immunity against the Herpes Simplex virus. Photizo® Skin Care reduces irritation and swelling and speed up the healing process.
